The most important aim of science should be to improve people's lives or not

I agree that the most important goal of science should be to make people's lives better. Science has helped us in many ways, especially in health and technology.

First, science has improved medicine and healthcare. Many diseases that were deadly in the past can now be treated. For example, vaccines protect us from illness, such as BCG, Polio and Hepatitis B, and new medicines help people live longer and healthier lives. Without science, we would still suffer from many serious diseases.

Second, science has made life more comfortable through new technology. Electricity, transportation and internet have changed the way we live. For example, cars and ~~airplanes~~ airplanes help us travel quickly, and mobile phones let us talk to people anywhere in the world. These inventions make life easier and more enjoyable.

In conclusion, science is very important because it helps us stay healthy and makes daily life easier.

While science can also be used for other purposes, its main goal should always be to improve people's lives.

I do not hold the idea that success is ~~mostly~~ a matter of luck rather than hard work.

I go along with the opinion that watching television has a negative impact on children.

I disagree that all secondary school students should be required to study art and music as compulsory subjects.

I am not in ~~favor~~ favor of the idea that only wealthy people can be considered successful.

I agree that childhood is the most important period in a person's life.
