

First, family teaches us the core value that shapes who we will become. At home, we learn kindness through our parents' action. In addition, seeing them manage struggle and fulfill responsibility from daily chores, we internalize these qualities and life lessons, which form our character long before we step into classroom, and it helps us develop emotional intelligence and resilience. For instance, the advice from parents about treating others with respect guides us far more profoundly than any textbook lessons.

Second, although school provides valuable knowledge, it is our family's support that helps us apply it. When students feel overwhelmed by school pressure, it is our parents who teach us to persevere. They help us turn academic knowledge into real-world wisdom. For example, in math classes, teachers teach students equations, while parents show them how to budget money. When students stress about exams, family support helps them persevere, which has a lasting impact than any <sup>other</sup> more psychology classes.

In conclusion, although school provides important knowledge, family teaches us how to use it in life. Values such as resilience and practical wisdom from home ultimately play a more essential role in long-term success more than exam results.

I am glad you are interested in the UN's Initiative. I suggest you write a proposal on environmental protection. I believe this is a great topic because environmental problems like global warming, air pollution, and waste are getting worse. As teenagers, we have the power to influence others and raise awareness. You could focus on daily actions like reducing plastic use, recycling waste, saving electricity, or organizing a tree planting event in your local community. These actions are easy to carry out but can have a lasting impact. Your proposal can encourage more young people to take part in protecting our planet. If everyone does a little, we can make a big difference together.

Or: using less electricity
